

Phase 1 MVP Architecture Blueprint

A complete logical-to-Azure design for all 22 priority use cases

SLICE A

Access & Eligibility

SLICE B

Opportunity & DD

SLICE C

Investment & Settlement

SLICE D

Portfolio & Servicing

SLICE E

Governance & Control

The architecture story in one page

What changed, what Phase 1 means and how to read this Blueprint

SCOPE

BUSINESS

TECHNICAL

READINESS

41 total use cases

The complete reconstructed product catalogue remains the long-term system boundary.

22 Phase 1 priorities

These use cases form the approved MVP release boundary and must remain traceable.

5 delivery slices

Incremental sequencing controls risk without moving priority capabilities out of Phase 1.

THE CENTRAL CORRECTION

The non-binding EOI journey is the first architecture-validation increment - not the complete Phase 1 MVP.

- All 22 priority use cases have an explicit logical owner and technical placement.
- Settlement, portfolio, documents, notifications and reporting are inside Phase 1, with explicit decision gates.
- Architecture coverage does not advance implementation status; delivery still requires objective evidence.

HOW TO READ THE DOCUMENT

Scope establishes the boundary. Business architecture defines responsibilities. Technical architecture maps them to Azure. Readiness defines the evidence and decisions required to proceed.

Phase 1 scope at a glance

The 22 priority use cases grouped into five coordinated delivery slices

PHASE 1 COMPLETION RULE

The MVP release is complete only when all 22 scoped use cases meet their agreed functional, security, persistence, integration, audit, deployment and E2E evidence gates.

SECTION 01

Business Architecture

Capabilities, ownership and controlled business progression

Start with what the business must control. Technology follows responsibility - not the other way around.

The complete Phase 1 capability map

A technology-neutral view of actors, responsibilities and control boundaries

SCOPE

BUSINESS

TECHNICAL

READINESS

ARCHITECTURE RULE

A logical capability owns a business responsibility. It does not automatically imply a separate microservice, deployment or database.

Deliver the MVP as connected slices

A dependency-aware sequence that reduces risk without shrinking Phase 1 scope

SCOPE

BUSINESS

TECHNICAL

READINESS

FIRST IMPLEMENTATION INCREMENT

Authentication + permitted opportunity discovery + non-binding EOI + audit validates the architecture early. It does not complete Phase 1.

Slice A - Access and eligibility

UC-IAM-001 · UC-ONB-001/002/003 · UC-INT-001 · supporting UC-ADMIN-003

SCOPE

BUSINESS

TECHNICAL

READINESS

**BOUNDARY PROTECTED**

Entra answers 'who authenticated?'. Ubuntu Capital OS answers 'which account?', 'is the investor eligible?' and 'may this actor perform this action?'.

Slice B - Opportunity and due diligence

UC-ADMIN-001 · UC-OPP-001/003 · UC-DD-001/002

SCOPE

BUSINESS

TECHNICAL

READINESS

SECURITY RULE

React may hide unavailable actions, but protected-document access must be authorised by the backend. A permanent Blob URL is not an access-control design.

Slice C - Investment and settlement

UC-INV-001/002 · UC-SET-001/002 · UC-INT-004

SCOPE

BUSINESS

TECHNICAL

READINESS

Slice D - Portfolio and investor servicing

UC-PORT-002/003 · UC-DOC-001 · UC-NOTIFY-001

SCOPE

BUSINESS

TECHNICAL

READINESS

**DATA-INTEGRITY RULE**

An EOI or received payment must not automatically create a holding. Portfolio ownership begins only from the approved ownership-creation process.

Slice E - Governance, audit and reporting

UC-ADMIN-003 · UC-AUD-001 · UC-REPORT-001

SCOPE

BUSINESS

TECHNICAL

READINESS

SECTION 02

Technical Architecture

How the logical model is implemented on the selected Azure platform

Azure provides the runtime. Ubuntu Capital OS retains ownership of business policy, state and evidence.

Azure platform view

Experiences, protected processing, data, integrations and platform controls

SCOPE

BUSINESS

TECHNICAL

READINESS

TECHNICAL BOUNDARY

External providers perform specialist functions. Ubuntu Capital OS remains authoritative for eligibility, NDA/access state, settlement, holdings, notification intent and audit evidence.

Capability mapping - investor journey

Direct trace from the core business journey to experience, backend and Azure implementation

CAPABILITY	EXPERIENCE	BACKEND RESPONSIBILITY	AZURE / INTEGRATION
Identity & access	Sign-in/session	Identity context and API enforcement	Entra · Functions
Onboarding & eligibility	Registration/profile	Eligibility policy and KYC adapter	Functions · SQL · provider
Opportunity	Catalogue/detail/admin	Publish and read APIs	Functions · SQL
NDA & due diligence	NDA/data room	Agreement and access-grant policy	Functions · SQL · Blob
Investment intent	EOI/pending	EOI lifecycle and operator review	Functions · SQL
Funding & settlement	Instructions/ops	Funding reference and reconciliation	Functions · SQL · provider

WHY THIS MAPPING MATTERS

- No capability disappears inside a generic Functions box.

IMPLEMENTATION DIRECTION

One Functions deployment and one SQL database may host the MVP, provided module responsibilities, authorised writes and migration ownership remain explicit.

Capability mapping - servicing and control

The technical home for the capabilities omitted from the earlier Blueprint

SCOPE

BUSINESS

TECHNICAL

READINESS

Portfolio Management

EXPERIENCE

Holdings and performance UI

BACKEND / AZURE

Ownership and valuation read models · Functions + SQL

BUSINESS AUDIT

Management Reporting

EXPERIENCE

Reports and dashboards

BACKEND / AZURE

Governed reporting from authoritative stores · Reporting API +

REPORT OUTPUT

GAP CLOSED

Settlement, portfolio, documents, notifications and reporting now have explicit logical ownership, technical placement and authoritative data boundaries.

Authoritative data and ownership

The official business truth, the capability accountable for it and the meaning of the boundary

AUTHORITATIVE DATA	AUTHORITATIVE OWNER	WHAT THE OFFICIAL FACT MEANS
Identity/account link	Identity & Access	Extra subject mapped to Ubuntu account
Investor eligibility	Onboarding & Eligibility	Profile, verification evidence and eligibility decision
Opportunity state	Opportunity Management	Draft, approval, publication and availability
NDA/access grant	NDA & Due Diligence	Agreement evidence and current protected access
EOI/review state	Investment Intent	Non-binding submission and operator resolution
Settlement state	Funding & Settlement	Instruction, receipt, match and exception
Holding/performance	Portfolio Management	Validated ownership and valuation read model
Document/delivery	Documents & Notifications	Availability, access, notification intent and outcome
Audit/report	Audit & Reporting	Material evidence and governed reporting output

Authoritative data

The official business fact that other capabilities must rely on.

Authoritative owner

The capability accountable for meaning, rules, changes and evidence.

STORAGE IS NOT OWNERSHIP
A shared Azure SQL database is acceptable for the MVP. It does not grant every module permission to update every business fact.

SECTION 03

Production Readiness

Evidence, controls, unresolved decisions and the path to acceptance

A target design becomes a production solution only when security, reliability, recovery and E2E evidence are demonstrated.

Controls that make the architecture operable

The non-functional responsibilities that apply across the full 22-use-case MVP

SCOPE

BUSINESS

TECHNICAL

READINESS

Security

Server-side authorization · least privilege · secrets isolation
· protected document mediation

Reliability

Idempotency · duplicate protection · safe failure ·
settlement reconciliation

Privacy

PII minimisation · access scopes · retention · secure logs
and documents

Auditability

Durable business evidence · agreement versions · financial
decisions

Observability

Logs · metrics · traces · correlation IDs · alerts and business
health

Recovery

Backups · restore testing · RPO/RTO decisions · runbooks
and manual recovery

FAILURE SCENARIOS THAT MUST BE DESIGNED AND TESTED

KYC/PROVIDER UNAVAILABLE

DUPLICATE EOI OR PAYMENT

STALE ELIGIBILITY OR NDA

INCORRECT VALUATION/REPORT

TARGETS STILL TO APPROVE

Availability, RPO/RTO, retention and performance targets remain architecture decisions. This Blueprint identifies where they apply without inventing values.

What is established - and what remains to prove

A clear separation between target architecture, implementation evidence and acceptance

SCOPE

BUSINESS

TECHNICAL

READINESS

Established by this Blueprint

22-use-case scope · five slices · logical ownership · Azure mapping · control boundaries · missing-capability architecture

Not proven by this Blueprint

Deployed services · working integrations · settlement legality · production controls · E2E completion · operational acceptance

Evidence position

A defensible target design exists. Repository evidence remains primarily planning and component-level until objective delivery evidence is captured.

01

Approve the 22-use-case scope register and five-slice sequence.

02

Reconcile Phase 0-4 actors, rules, journeys, states, integrations, backlog and traceability.

03

Close Azure Foundation and shared-capability evidence gates.

04

Approve settlement, ownership, provider and portfolio-calculation decisions.

05

Deliver every slice through UI, API, persistence, security, audit, deployment and E2E evidence.

FORMAL READINESS DECISION

Phase 1 is accepted only when all 22 scoped use cases meet their approved completion evidence and no unresolved critical decision invalidates regulated behaviour.

22-use-case coverage matrix - business journey

Every access, opportunity, investment and settlement use case has an architectural home

SCOPE

BUSINESS

TECHNICAL

READINESS

USE CASE	SLICE	LOGICAL OWNER	PRIMARY TECHNICAL IMPLEMENTATION	VIEW
UC-IAM-001	Access	Identity & Access	Entra + IAM API	7
UC-ONB-001	Access	Onboarding	React + Functions + SQL	7
UC-ONB-002	Access	Onboarding	Functions + SQL	7
UC-ONB-003	Access	Eligibility	Functions + provider + SQL	7

UC-DOC-001	Servicing	Documents	Functions + Blob	10
UC-NOTIFY-001	Servicing	Notifications	Functions + provider	10
UC-ADMIN-003	Control	Access Administration	Admin UI + policy APIs	11
UC-AUD-001	Control	Audit & Evidence	Functions + durable store	11
UC-REPORT-001	Control	Management Reporting	Reporting API + SQL	11

22 / 22

Every priority use case has explicit logical ownership, technical placement and a detailed architecture view.

5 slices

The full MVP is delivered incrementally with clear dependency and evidence gates.

1 rule

No use case advances because documentation or isolated components exist.

FINAL TAKEAWAY

The target architecture is complete for the 22-use-case boundary. The next work is evidence-led delivery, decision closure and repository reconciliation.
